

y -axis=some
measurement of model

similar start

different paths

different ends

x -axis=time

The graph illustrates three distinct trajectories starting from the origin (0,0). The vertical axis represents a measurement of the model, and the horizontal axis represents time. The black curve rises to a peak and then declines. The blue curve rises steadily and levels off at a high value. The green curve rises steadily and levels off at a lower value than the blue curve. The label 'similar start' points to the origin, 'different paths' points to the diverging curves, and 'different ends' points to the final values of the curves.
